Session I	14
13:30-15:4	15   Tanggula Hall @ 17th floor
CA006	A Gas-Liquid Coupling Excitation Control System Development and Simulation
CA010	Robust stability analysis of fractional-order linear systems with polytopic uncertainties
CA024	Synergetic Controller for Hepatitis B Epidemic System
CA1009	An Improved Algorithm for Image Synthesis
CA3001	The Study of the Collision Risk Control across Flight Level between Military and Civil Aviation Based on Event Model
CA011	On Robust Stability of 2-D Linear Discrete Systems described by the Recursive Model
CA1019	Infrared and Visible Image Fusion in Realistic Streetscape
CA1021	Histogram Equalization Based on Custom Region of Interest
CA1020	Analysis and Comparison of Grayscale Correction
Session I	I19
16:00-18:3	30   Tanggula Hall @ 17th floor
CA1002	Design and Reliability Analysis of The Hydraulic System of The Live Working Robot in Substation
CA1011	A Fast Contour Model-based Localization Method for Robotic Picking in Shrimp Production Line
CA1013	Semantic Scene Segmentation for Indoor Robot Navigation via Deep Learning
CA1016	An Innovative Error Measuring Method for Modular Interfaces of Modular Reconfigurable Robots
CA023	Integral Backstepping-based Nonlinear Flight Control Strategy for Quadrotor Aerial Robot with Unknown Mass
CA033	Grip Force Estimation of Laparoscope Surgical Robot based on Neural Network optimized by Genetic Algorithm
CA018	Design of fractional order guidance law based on variable order state space
CA2001	Design and Implement of Vehicle-Based Experiment Prototype for Expressway Tunnel Intelligent Detection

# **CONTENTS**

CA2002	The influence of wing kinematic pattern of biplane flapping wings on the production of aerodynamic forces
MV1003	Lane decision algorithm for active avoidance of intelligent vehicle based on improved back propagation neural network
Session II	II
	5   Hongshan Hall @ 17th floor
MV003	Research on key problems of data quality in large industrial data environment
CA005	A Variable Precision Multi-granulation Rough Sets Model Based on Multiple Classification Error Rates and Constraint
CA022	Research and Development of Data Acquisition System for Cement Enterprises Based on Multi-threading Technology
CA025	A rapid localization method of radiation sources used for multi-sensor networks
CA026	Design of Angle Measurement System for Dual Polarization Monopulse Radar in Main lobe Jamming
CA029	Pulse Shape Discrimination of $n-\gamma$ Based on Pulse Shape Model and Adaptive Kalman Filter
CA035	Prediction Model of Dissolved Oxygen Based on SADE-RVM
CA1010	Vehicle Window Detection Based on Hough Transform and Integral Projection
CA1024	Contrapositive Margin Softmax Loss for Face Verification
Session I	V
16:00-18:1	5   Hongshan Hall @ 17th floor
MV004	Adaptive Hierarchical Siamese Network for Object Tracking
CA008	Lower Limb Movement Intent Recognition Based on Grid Search Random Forest Algorithm
CA1007	Research of Unlabeled Identification Technology of Equipment Based on Machine Vision
CA1008	Target tracking based on improved STRCF algorithm
MV007	Visual Path Tracking Control for Park Scene
CA002	The improved chaotic PSO for the optimization research on multi-cameras network
CA1005	Quadratic Assignment Problem via a Convex and Concave Relaxations Procedure
CA1004	Image Augmentation for Classifying Facial Expression Images by Using Deep Neural Network Pre-trained with Object Image Database
CA3004	1 1

[August 11, 2018]

(L) 10:00-17:00

Give your Paper ID to the staff

**Sign your name** in the attendance list and check the paper information.

Check your conference kit, which includes conference bag, name tag, pen, lunch & dinner coupon, conference program, the receipt of your payment, and the USB of paper collection.

- ❖ Your punctual arrival and active involvement in each session will be highly appreciated.
- ♦ The listeners are welcome to register at any working time during the conference.
- ♦ Get your presentation PPT or PDF files prepared.
- ❖ Regular oral presentation: 15 minutes (including Q&A).
- ◆ Laptop (with MS-Office & Adobe Reader), projector & screen, laser sticks will be provided by the conference organizer.
- ❖ Please keep all your belongings (laptop and camera etc.) with you in the public places, buses, metro.

# [August 12, 2018] MORNING

◎ Tanggula Hall @ 17th floor(唐古拉厅-17 楼)

09:00-09:10	Opening Remarks	<b>Prof. Zou Jianxiao,</b> University of Electronic Science and Technology of China, China	
	Keynote Speech	<b>Prof. Toyomi Fujita,</b> Tohoku Institute of Technology, Japan	
09:10-10:00	ı	Speech Title: Regions of Interest in Observation of Robot Hand Movement for Robot Cooperation	
		Coffee Break & Group Photo	
10:00-10:30	Poster display Foyer @ Tanggula Hall @ 17th floor

#### **Excursion**

### [August 13th, 2018]

08:30	Assemble at the lobby of Tibet Hotel Chengdu
8:30-12:00	Chengdu Giant Panda Base
12:00-13:00	Lunch
13:00-14:30	Kuan & Zhai Alley (China Lane)
14:30-16:00	Qingyang Taoist Temple
16:00-17:00	Jinli Ancient Street
17:00	End-Back to Tibet Hotel Chengdu

#### Notes:

- 1. The cost of one-day tour is 60USD per person for participants.
- 2. The payment of the excursion should be completed by August 1st.
- 3. Onsite excursion registration is unacceptable.
- 4. Please keep your belongings with you.

#### Chengdu Giant Panda Base (成都大熊猫基地)

Chengdu Giant Panda Base is located just 10km (6miles) away from downtown Chengdu, the Chengdu Panda Breeding Research Center has been created and imitated the pandas' natural habitat in order that they might have the best possible environment for rearing and breeding.

#### Kuan & Zhai Alley (China Lane) (宽窄巷子)

Kuan & Zhai Alley is one of the three historical and cultural protection areas in Chengdu. It is composed of three urban old streets arranged in parallel: wide alley, narrow alley and well alley and the quadrangle courtyard community between them.

#### Qingyang Taoist Temple (青羊宫)

Qingyang Taoist Temple is known as "the first Taoist temple in western Sichuan" and "the first jungle in southwest China", it is a national famous cultural relic and tourist attraction, and the largest Taoist temple in southwest China

#### Jinli Ancient Street (锦里)

Jinli was one of the oldest and most commercial streets in the history of western shu, and was famous throughout the country as early as the qin and han dynasties and The Three Kingdoms period. It fully shows the unique charm of Sichuan folk customs.

## WELCOME

Dear professors and distinguished delegates,

It is our great honor and pleasure to welcome you to Chengdu, China for 2018 The 3rd International Conference on Robotics, Control and Automation (ICRCA 2018) and 2018 3rd International Conference on Robotics and Machine Vision (ICRMV 2018), which is co-sponsored by Hefei University of Technology, China, University of Electronic Science and Technology of China and China University of Geosciences and also technically assisted by many universities worldwide.

The theme of the conferences is to proclaim knowledge and share new thoughts among the professionals, industrialists and students from research areas of robotics, control and automation as well as robotics and machine vision, and to demonstrate and examine different innovative approaches in related fields. The evaluation of all the papers was performed based on the reports from anonymous reviewers, who are qualified in the related field. As a result of their hard work, we are pleased to have accepted 41 presentations in this program.

Three keynote speeches will be presented from Prof. Zou Jianxiao, University of Electronic Science and Technology of China, China; Prof. Chiharu Ishii, Hosei University, Japan; P Prof. Toyomi Fujita, Tohoku Institute of Technology, Japan separately. We believe all the talks will be very impressive for the high level of professionalism, and in many cases original ideas and activities will be accomplished or proposed. We acknowledge the important contributions of these three professors here.

Apart from this, the conference is set up with 4 parallel Sessions. Participants will make presentations and discussions over 4 topics, i.e. Control theory and engineering; Artificial intelligence and robot; Electronic information technology and applications and Pattern recognition and target tracking. In addition to the core oral presentation, the conference also has poster session, which provides more opportunities for experts and scholars to communicate with each other.

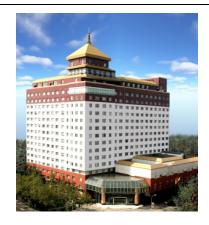

We believe that by this excellent conference, you can get more opportunity for further communication with researchers and practitioners with the common interest in this field. Obviously, your suggestions are warmly welcomed for the further development of the conferences in the future. Wish you have a fruitful and memorable experience in Chengdu, which is known as the "Country of Heaven" and the "Land of Abundance"!

We look forward to meeting you again next time.

Yours sincerely,

**Conference Organizing Committee** 

## **VENUE**

Add: **No.10, North Renmin Road, Chengdu, China** 地址: 成都人民北路一段 **10** 号

Website: http://www.tibethotelchengdu.cn/index.html

#### Tibet Hotel Chengdu Location:

Tibet Hotel Chengdu is located at No.10, North Renmin Road, Chengdu. It is near Manjusri Square, Living Water Park. It may just take you 5 minutes from the hotel to Chengdu North Railway Station(2 km), and 30 minutes to Chengdu Shuangliu International Airport(27 km).

Distance From Chengdu North Railway Station: 2 km Distance From Chengdu South Railway Station: 18 km

Distance From Chengdu Shuangliu International Airport: 27 km

Distance From Chunxi Road: 4 km

Distance From Pacific Department Store (Quanxing shops): 2 km

#### Warm tips:

Weather: Cloudy, temperature 24 °C ~ 34 °C, carry an umbrella with you.

## **KEYNOTE I**

Prof. Zou Jianxiao,
University of Electronic Science and Technology of China, China

Prof. Dr. Jianxiao Zou is vice president of Department of Automation Engineering, University of Electronic Science and Technology of China. He is visiting Professor of University of California, Berkeley (UC Berkeley). His main

research directions are intelligent information processing and control, new energy control and integration, monitoring and control system signal processing technology.

As a leader and a total commitment to the primary research included 863 projects, the National Natural Science Foundation of China, the General Armament Department pre-research, all kinds of national and provincial Department more than 20 projects, including a horizontal cooperation. Research in wind power, electric cars, scenery storage co-generation systems, aircraft gas turbine power and other new energy to change direction, and equipment acquired medical equipment, get a good economic and social benefits. MW class wind power generation control system is completed, the electric multi- leaf collimator system, aircraft gas turbine power generation system has been modified to achieve industrialization.

He won the Sichuan Provincial Science and Technology Progress Award in 2012, the Ministry of Education Science and Technology Progress Award in 2008, and the Sichuan Provincial Science and Technology Progress Award in 2006. In recent years, he applies for more than twenty national invention patents. He has published SCI, EI retrieved 20 papers, as the first author published and been reviewers of numbers of international conferences and magazines.

### Presentation Title: Key Control Techniques for Grid-Connected VSCs within Renewable Energy Generation Systems

Abstract: With the increasing demand for more effective and environmentally friendly electrical power system, the development of distributed generation and microgrid is promoted in a rapid pace. The grid-connected voltage source converter (VSC), with flexible topologies, becomes the most employed interface to realize renewable energy generation and power quality improvement. The performance of VSC relies heavily on the main circuit topologies, control techniques, electro-magnetic interference (EMI), etc. In this speech, the most recent research work regarding control strategies for grid-connected VSCs, which have been carried out in the Renewable Energy and Smart Grid Automation Technology Lab at UESTC, will be introduced. It includes design of internal model based current control strategy and finite control set model predictive control for grid-connected VSCs, aiming at improving the performance of VSCs as well as the high power quality of the injected power.

## **KEYNOTE II**

Prof. Chiharu Ishii, Hosei University, Japan

Chiharu Ishii received Bachelor of Engineering degree in Mechanical Engineering from Sophia University in 1992, Master of Engineering degree in Mechanical Engineering from Sophia University in 1994 and Doctor of

Engineering degree in Mechanical Engineering from Sophia University in 1997.

He worked at Ashikaga Institute of Technology between 1997 and 2002, at Kogakuin University between 2002 and 2009, and at Shibaura Institute of Technology between 2009 and 2010. He has been working at Hosei University since 2010, and currently working as a Professor with the Department of Mechanical Engineering, Faculty of Science and Engineering at Hosei University.

Dr. Chiharu Ishii has received several awards such as The Best Paper Award in the area of Tactile and Haptic Interfaces at the 4th International Conference on Human System Interaction (HSI2011); Best Paper Award at the 1st International Conference on Computer Science, Electronics and Instrumentation (ICCSE2012); Best Presentation Award at the International Conference on Intelligent Mechatronics and Automation (ICIMA2013).

He is currently a member of IEEE, SICE, JSME, RSJ, IEEJ and JSCAS. His research interests are in medical robotics, assistive technology and robust control.

### Presentation Title: Challenge for Development of Medical and Assistive Devices Toward Aging Society

**Abstract:** Japan is facing a serious problem of population aging. The percentage of elderly people of age 65 years or over (aging ratio) is 27.3% in 2017, and it is forecasted that the aging ratio becomes 33.4% in 2035. In this way, Japan has reached a super-aged society which no country in the world has experienced. Becoming the super-aged society, it is necessary to respond to the demand of medical care and nursing of elderly people. Therefore, challenge for development of medical and assistive devices through an application of the Robot Technology (RT) has been promoted. In this talk, some medical and assistive devices developed in my laboratory are explained.

The robotic surgical system for single-port-surgery termed "HASROSS", the lightweight power assist suit termed "Cool Vest" to reduce care giver's burden in transfer work, the ultra-lightweight power assist suit termed "Aero back" to support the work with a half-sitting posture, control system of the electric wheelchair based on user's biosignals, such as EMG, EOG and EEG, and sensory feedback device for myoelectric prosthetic hand, are mentioned.

## KEYNOTE III

Prof. Toyomi Fujita, Tohoku Institute of Technology, Japan

Toyomi Fujita have received his Ph.D. in Robotics from the Tohoku University, Japan, in 1997. From 1997 to 2001 he has been a Research Associate at the

Graduate School of Information Systems, the University of Electro-Communications, Tokyo, Japan. He joined, in 2001, the Neurology and Telerobotics Units, in the School of Optometry at the University of California, Berkeley, USA. He has been with the Department of Electronics and Intelligent Systems, Tohoku Institute of Technology, Japan. He is currently a Professor of the Department of Electrical and Electronic Engineering, Tohoku Institute of Technology. His research interests include robotics, robot vision, and human interface.

### Presentation Title: Regions of Interest in Observation of Robot Hand Movement for Robot Cooperation

**Abstract:** Visual functions are important for robots who engage in cooperative work with other robots. In a cooperative work, a robot needs to observe its partner robot using vision and be aware of its action. In order to develop an effective visual function for robots, it is important to detect some regions-of-interest in the visual field like human visual scanpath.

Our research group has therefore investigated features of the human visual scanpath in a scene of robot hand movement observed by a cooperative robot. Human regions-of-interest (hROIs) were measured by psychophysical experiments based on eye-movement measurement and different sets of hROIs were compared by using a positional similarity index. This talk will describe an overview of the experiment and results.

In addition, this talk will present a method for generating regions-of-interest in the scene of robot hand movement. Image processing algorithms based on active top-down feature patterns and bottom-up spatial kernels were applied. The algorithms have produced energy maps from the images observed by the robot and they were combined with different weights to generate algorithmic regions-of-interests. They were compared with measured hROIs and an algorithmic predictability of scanpath was evaluated. Several results of this experiment showed that presented method is applicable to the detection of regions-of-interests in hand movement.

#### \*Note:

- Please arrive 30 minutes ahead of the sessions to prepare and test your PowerPoint.
- After each presentation, a certificate will be awarded to each presenter by the session chair one by one.
- One Best Presentation will be selected from each parallel session and the author of best presentation will be announced and awarded when the session is over.

	A Gas-Liquid Coupling Excitation Control System Development and Simulation
	ZHANG Huixian, ZHANG Lijie, MIAO Lingxia
	Luoyang Institute of Science and Technology, Henan Province, China
	ABSTRACTIn order to study proactively generated cavitation bubble, a gas-liquid
	coupling excitation mode is proposed and the gas-liquid coupling test system is developed.
	In this control system, the gas and the hydraulic oil are mixed alternately and whose pressure
	can be adjusted manually, through which the generated cavitation bubbles can strip
CA006 13:30-13:45	contaminants adhered to the pipe inner wall rapidly. The cavitation bubble kinematics model
	is established and the numerical simulations are carried out. The factors affecting the
	cavitation bubble growth is studied. The results show that the cavitation effect will be
	enhanced with increasing air pressure. Meanwhile, the cavitation process will evolve from
	steady state to transient state. So, it can be concluded that the gas-liquid coupling
	excitation-induced cavitation process is controllable, which provides a new cleaning method
	for the complex hydraulic system and some theoretical basis on the gas-liquid coupling
	excitation are obtained.
	Robust stability analysis of fractional-order linear systems with polytopic uncertainties
	Jing Yang, Xiaorong Hou
	School of Automation Engineering, University of Electronic Science and Technology of
	China, Sichuan, P.R.China
CA010 13:45-14:00	ABSTRACTThe issue of robust stability for fractional-order linear systems with polytopic
	uncertainties is dealt with in this paper. Based on the Kronecker product and -analysis, stable
	condition is established. Moreover, the robustness bounds of fractional-order linear systems
	with polytopic uncertainties are given. Two examples are presented to confirm the proposed
	conditions.
	Synergetic Controller for Hepatitis B Epidemic System
CA024 14:00-14:15	Arsit Boonyaprapasorn, Thanacha Choopojcharoen, Parinya Sa Ngiamsunthorn and Kaned
	Thung-Od
	Mechatronics Research Unit, Mahasarakarm University, Thailand

	ABSTRACTThe hepatitis B virus (HBV) has been interested by researchers to define
	control policy for the epidemic of this virus. In this study, the synergetic control approach
	was applied to determine the policy which consists of isolation, treatment, and vaccination
	for the epidemic system, including susceptible, acute infected, chronic infected and recovery
	individuals. The simulation was used to present the feasibility of the synergetic control
	approach in defining of all types of control inputs. It is clear from the simulation results that
	the hepatitis B epidemic system can be controlled based on the control policy including the
	isolation, treatment and vaccination provided by the synergetic control method. According to
	the results of this study, the control objective of the hepatitis B epidemic system can be
	achieved by using the synergetic controller. Additionally, the hepatitis B epidemic system
	could be controlled with the chattering free control inputs. Thus, it is suitable to utilize the
	synergetic approach for determination of control policy for the considered hepatitis B
	epidemic system.
	An Improved Algorithm for Image Synthesis based on gradient and database
	Xiang Zhang, Wei Yang, Yunhe Zhang, Jie Liu, Shishi Zhou
	Chongqing University, China
	ABSTRACTWith the problem of distortion in boundary and time-consuming in image
CA1009 14:15-14:30	synthesis, an improved algorithm base on Image Quilting is proposed. Firstly, the gradient of
	image is add to the color feature which is used as the metric for texture blocks stitching.
	Further, the way of texture blocks selecting is improved by storing the feature information of
	four edges to the database. The experiment shows that the improved algorithm reduces the
	distortion and time for generating high quality images effectively
	The Study of the Collision Risk Control across Flight Level between Military and Civil
CA3001 14:30-14:45	Aviation Based on Event Model
	Han LI, Guhao Zhao, Dengkai YAO
	College of Air Traffic Control and Navigation, Air Force Engineering University
	Xi'an, China
	ABSTRACTIn order to easy the contradiction in airspace using between military and civil

	aviation, and to ensure air safety, Event model is used to make delimitation more scientific
	and credible. The case is half a roll back. By simulating war craft's path and calculating
	frequency of side spacing loss under the influence of the navigation error, pilot error and
	lateral wind, the collision probability model can be used to military aerobatic training flight,
	so that someone can put forward some suggestions about airspace and flight.
	On Robust Stability of 2-D Linear Discrete Systems described by the Recursive Model
	Xiaoxue Li and Xiaorong Hou
	University of Science and Technology of China
	ABSTRACTIn this paper, we present a new criterion on robust stability of
	two-dimensional (2-D) linear discrete systems. This method is based on the discriminant
CA011 14:45-15:00	systems of polynomial and Hurwitz theorem. By the fractional linear transformation, the
11113 13100	problem of stability analysis for uncertain 2-D systems can be turned to a new problem
	whether the polynomials are Hurwitz stable, which can be easily checked by the discriminant
	system of polynomial. It simplifies some existing methods of analyzing stability for 2-D
	systems with uncertain parameters. A comparison is included to illustrate the presented
	criterion is more effective than previously reported criterion.
	Infrared and Visible Image Fusion in Realistic Streetscape
	Huang Yudong, Xu Wei, Tan Hanlin, Long Xin and Ben Zongcheng
	National University of Defense Technology, China
	ABSTRACTInfrared and visible image fusion plays an important role in military and
	civilian applications. However, most methods are focus on simple general scene, which only
CA1019 15:00-15:15	contains one person alone or a few buildings. It is not enough to fully reflect the diversity
	and complicated of reality. This paper presents a new fusion method for infrared and visible
	images based on saliency detection and guided filter, aiming to obtain a synthetic image that
	is suitable for human visual perception in complicated street scenes. The proposed method
	employs the saliency detection to extract target region from infrared images. Each image is
	decomposed into a base layer and detail layers based on a multi-scale decomposition through
	guided filter. Experimental results demonstrate that our method can achieve a superior

	performance compared with previous image fusion methods in both subjective and objective
	evaluation.
	Histogram Equalization Based on Custom Region of Interest
	Longzhi Zhang, Huan Jin and Dongmei Wu
	State Key Laboratory of Robotics and System, Harbin Institute of Technology, China
	ABSTRACTImage enhancement has been widely used in aerospace, biomedicine,
	industrial production, and public safety. However, problems such as poor real-time
CA1021	performance of methods and inflexible selection of local enhancement regions often occur
15:15-15:30	during the period of enhancement. To solve these issues, we propose a histogram
	equalization method based on custom region of interest (CROIHE), which could arbitrarily
	select position and size of interest region to enhance. Compared with the commonly global
	enhancement methods, our method has shorter computation time and better performance in
	real-time field. Besides, the proposed approach also has good enhancement effect and strong
	robustness in enhancing interest areas of different positions and sizes.
	Analysis and Comparison of Grayscale Correction
	Longzhi Zhang, Huan Jin and Dongmei Wu
	State Key Laboratory of Robotics and System, Harbin Institute of Technology, China
	ABSTRACTImage enhancement as an effective means to improve image quality, is still a
	basic topic in image processing, which has attracted largely attentions from researches. Yet
CA1020	among enhancement algorithms, grayscale correction, including gray transformation and
15:30-15:45	histogram processing, is widely used because of its simple principle. Hence, this paper
	discuss commonly used algorithms in above two categories, and apply them for different
	scenarios, to obtain their enhance effect. Through analyze and compare their distinctions
	from theory to experiment, we found that these methods are still to be improved, for instance
	in real-time, and grayscale. This paper is a fundamental investigate on image processing,
	which could provide a reference for further research on image enhancement.

	Design and Reliability Analysis of The Hydraulic System of The Live Working Robot in
CA1002 16:00-16:15	Substation
	Xin Zhang, Shungui Liu, <b>Qiang Chen</b> , Jian Li, Huadong Zhang, Yuming Gao
	Shenzhen Power Supply Co. Ltd., China
	ABSTRACTWith the continuous development of the smart grid, the electrified work in the
	substation is becoming more and more important and urgent. According to the special
	working condition of live working, a hydraulic system suitable for the live overhaul robot in
	substation is designed, and the system reliability is analyzed
	A Fast Contour Model-based Localization Method for Robotic Picking in Shrimp Production
	Line
	Niya Chen, Jiayang Ruan, Wei Yang
	ABB Corporate Research, China
	ABSTRACTIrregular-shape food processing by robotic arms like shrimp picking is a
	common problem in industrial automation, which can be summarized as localization of
	particular points on an image, emphasizing on both good accuracy and high speed with
	relatively very limited hardware resources. In most cases, the points do not have a distinct
	visual characteristic in color or size. In this paper, first we outline the suspicious search
CA1011 16:15-16:30	range resorting to intelligently learning the coarse mapping function between shrimp shape
	and target points, based on the proposed contour model of shrimp body, which significantly
	simplifies numerical representation of the original image. Next, priori knowledge of the
	shrimp body is used for more accurate fine localization of the target points. More
	specifically, in this step, the shrimp body pose is normalized for edge extraction after proper
	rotation and projection. The extracted edge curve on the back of the shrimp is then analyzed
	to accurately pick out the target corner point. During validation, in the search region
	detection step, the method is able to efficiently avoid wrong search in neighboring joints of
	shrimp body. After finer localization of the target points, the final detection rate turns out
	to be 93%.
CA1013	Semantic Scene Segmentation for Indoor Robot Navigation via Deep Learning

## Session II

16:30-16:45

Yao Yeboah, Cai Yanguang, Wei Wu, Ziad Farsi

Guangdong University of Technology, China

ABSTRACT--Indoor robot navigation is a challenging research problem dominated by solutions that exploit complex sensor hardware and stringent offline calibration techniques. This paper presents a vision-based approach which exploits semantic segmentation and deep learning for accurate and efficient indoor scene mapping and collision-free navigation for hardware constrained robotics. Firstly, an accurate and efficient path extraction from complex indoor scenes using deep convolutional neural networks (DCNNs) and transfer learning for semantic pixel-wise segmentation is put forward. Secondly, multiple DCNN architectures and semantic segmentation techniques are explored to highlight the challenges associated with implementation as well as the trade-offs between accuracy and efficiency associated with the state-of-the-art. Finally, the achieved models are deployed and experimentally analyzed. Experimental results highlight promising potential with good accuracies and real-time feasibility in path extraction for collision-free navigation. Results further highlight significant accuracy-efficiency trade-offs which are strongly driven by model decoder sub-network design.

An Innovative Error Measuring Method for Modular Interfaces of Modular Reconfigurable Robots **Zizhen Jiang,** Wenbin Gao and Xiaoliu Yu

Anhui University of Technology, China

CA1016 16:45-17:00 ABSTRACT--To improve the accuracy of modular reconfigurable robots by kinematic parameter calibration, currently, the studies mostly adopt calibrating and compensating methods of common robot arm to modular reconfigurable robots. This kind of methods need external measuring equipments to carry out sophisticated operations and cannot realize the original research intention of high precision operations after the rapid reconfiguration of a modular robot. By analyzing the geometric size errors of module body and the assembly errors between modules, this paper proposes a calibration method for modular reconfigurable robots based on parameters measurement, which is replacing the machining and assembly precision with measured ones. For this, a pair of module interfaces is designed. The position

	and angle errors can be recognized in the assembly interfaces of module by using the relative
	geometric position between the range sensors of configuration and the pairing interfaces, and
	the sensor reading. The method achieves an active decoupling for assembly errors between
	modules. It establishes the foundation for the rapid compensation of the modular robot after
	reconfiguration.
	Integral Backstepping-based Nonlinear Flight Control Strategy for Quadrotor Aerial Robot
	with Unknown Mass
	Jin Wang, Zhou Fang and Wenjie Zhao
	School of Aeronautics and Astronautics, Zhejiang University, China
	ABSTRACTThis paper aims at obtaining a stable and rapid-responsive controller for
	quadrotor aerial robots with unknown or changeable mass. Based on Newton-Euler formula,
	integral backstepping method and fractional-order PI/PD control, an adaptive flight control
CA023 17:00-17:15	strategy is carried out in Matlab with Lyapunov stability theorem to ensure its stability. The
	control strategy includes cascade fractional PI/PD control for rotational loop and integral
	backstepping control for translational loop. Through the comparison with conventional PID
	flight controller, main criteria for performance as setting time, maximum overshoot and
	steady-error show its improvement. After validating the proposed control system and
	controller tuning with several meta-heuristic algorithms, results from non-linear simulation
	verify the effectiveness and robustness for hovering or near hovering (near quasi-stationary)
	flight of quadrotors.
	Grip Force Estimation of Laparoscope Surgical Robot based on Neural Network optimized
CA033 17:15-17:30	by Genetic Algorithm
	Huang Jiaqing, Yan Zhiyuan and Xue Renfeng
	State Key Laboratory of Robotics and System, Harbin Institute of Technology, China
	ABSTRACTIn this paper, we described a method of sensorless grip force estimation based
	on Neural Network (NN) optimized by Genetic Algorithm (GA) to address the gripping
	force estimation problem of laparoscope surgical robots. The gripping force estimation
	problem is the key of haptic feedback in Robotic Minimally Invasive Surgeries (RMIS). We

	verified the proposed method and compared with the grip force estimated by dynamic model.
	The number of units of hidden layer was optimized so that it made a better fitting
	performance. The experimental results demonstrated that the proposed method had a good
	performance for the sensorless grip force estimation, which is well applied to our surgical
	robots.
	Design of fractional order guidance law based on variable order state space
	Changmao Qin, Qiong Tang and Jianhua Wen
	China Academy of Launch Vehicle Technology, China
	ABSTRACTIn the reentry process of hypersonic vehicle, the influence of external
	disturbance and aerodynamic environment is the key factor to control precision of terminal
CA018	guidance. Therefore, it is needed to design the guidance law with strong anti-interference to
17:30-17:45	improve the precision of terminal guidance. Based on the variable parameters and nonlinear
	reentry model of hypersonic vehicle, the fractional order guidance law is designed by using
	the theory of fractional order system and the optimal control theory. Simulation results show
	that the fractional order guidance law improves the precision of terminal guidance, and is not
	sensitive to the change of the guidance coefficient, also has good correction ability and
	strong robustness to the parameter deviation of reentry initial point.
	Design and Implement of Vehicle-Based Experiment Prototype for Expressway Tunnel
	Intelligent Detection
	LIU Xiao, DUAN Ying-jie, XUE Chun-ming, LIU Bo, LI Yang
	Shanxi Engineering Research Center for Road Intelligent Monitoring, Shanxi Transportation
CA2001 17:45-18:00	Research Institute, Shanxi Taiyuan, China
	ABSTRACTTraditional detection method used in expressway tunnel has the disadvantages
	of low detection speed, high risk and cannot realize disease information management, a
	method of design, implement and field test of vehicle-based experiment prototype for
	expressway tunnel intelligent detection is proposed in this paper. Firstly, based on the
	demands of expressway tunnel detection, the performance indicators of tunnel intelligent
	detection system are developed, which include detection speed, detection accuracy, visual

	system depth and so on. Then, for the visual system, inertial navigation system and
	mechanical system, an application-oriented method of hardware calculation, selection and
	design for tunnel detection system is proposed. Finally, according to the above conclusions,
	the vehicle-based experiment prototype is developed, and field test is carried out in
	expressway tunnel. The engineering practice shows that the developed tunnel intelligent
	detection system can collect tunnel surface image quickly, and the research results lay a
	foundation for tunnel intelligent system developing, image processing and disease intelligent
	identifying in next step.
	The influence of wing kinematic pattern of biplane flapping wings on the production of
	aerodynamic forces
	Tao Jiang, Juwei Huang, Hongwei Wang, Shen Tian, Long Cui
	State Key Laboratory of Robotics, Shenyang Institute of Automation Chinese Academy of
	Sciences, Shenyang, P.R China; Shenyang Ligong University, Shenyang, P.R China
	ABSTRACTThe aerodynamics of flapping wing micro air vehicle (FMAV) is significantly
	affected by the wing kinematics, primarily by the wing flapping and pitching. Designing the
CA2002 18:00-18:15	patterns of wing kinematics is an effective way to modulate the lift and thrust. This paper
	aims to investigate the aerodynamic effects of different combinations of flapping and
	pitching wings of biplane FMAV. We conducted three numerical simulations on biplane
	flapping wings using the computational fluid dynamics (CFD) method. Overset mesh
	technique was employed to improve the computational efficiency. Numerical simulation
	results showed that the thrust directly benefits from wing pitching, which also influences the
	lift. Explanation of this phenomenon was discussed. This work is highlighted by the insights
	into asymmetric wings pitching and the effects of it on the aerodynamic performance.
MV1003 18:15-18:30	Lane decision algorithm for active avoidance of intelligent vehicle based on improved back
	propagation neural network
	Yang Wang, Jindong Zhang, <b>Zengming Zhang</b> , Zifan Liu, Yuejia Song, Qipeng Miao
	College of Computer Science and Technology, Jilin University, Changchun, 130012, China
	Abstract— In view of the traditional intelligent vehicle lane decision algorithm is lack of

flexibility, and slow convergence speed of traditional back propagation neural network algorithm, the training time is long, easy to fall into local minimum values and without guiding network structure theory, by studying the traditional improving methods of back propagation neural network algorithm, introducing auxiliary weights adjustment parameters and contraction coefficient, abate sawtooth phenomenon, speed up the convergence speed and reduce the training time, and to some extent, improve the accuracy of intelligent vehicle lane decision for active avoidance. Through the synthetic judging three different lanes static target decision, compare the improved back propagation algorithm with the traditional algorithm in the actual lane decision algorithm for active avoidance accuracy and convergence time.

# Session III 16:00-18:15 Hongshan Hall @ 17th floor

	Research on key problems of data quality in large industrial data environment
MV003 13:30-13:45	Aizhang Guo, <b>Xiuyuan Liu</b> , Tao Sun
	Qilu University of Technology (Shandong academy of science), China
	Abstract— At present, the modern manufacturing and management concepts such as
	digitalization, networking and intellectualization have been popularized in the industry, and
	the degree of industrial automation and information has been improved unprecedentedly.
	Industrial products are everywhere in the world. They are involved in design, manufacture,
	operation, maintenance and recycling. The whole life cycle involves huge amounts of
	data.Improving data quality is very important for data mining and data analysis. To solve the
	problem of data inconsistency is a very important part of improving data quality.
	A Variable Precision Multi-granulation Rough Sets Model Based on Multiple Classification
	Error Rates and Constraint
	Biqing Wang and Changyong Liang, Qi Ping
	Tongling University, Tongling, China; Hefei University of Technology, Hefei, China
	ABSTRACT—In this article, a variable precision multi-granulation rough sets model based
	on multiple classification error rates and constraint(VMRMC) is presented aiming at the
CA005 13:45-14:00	problems of single classification error rate and neglecting constraint for granular spaces
	existed in current variable precision multi-granulation rough sets theory. The VMRMC
	enables classification error rates of different granulation to be adjusted independently and is
	in conformity with the practical applications. It can solve problems more efficiently and
	more flexibility. Further, a granular space reduction algorithm of VMRMC is designed,
	which can get ride of the irrelevant or redundant granular spaces. Eventually, an example
	illustrates the validity of the proposed model.
CA022 14:00-14:15	Research and Development of Data Acquisition System for Cement Enterprises Based on
	Multi-threading Technology
	He Zhu, Shaohong Jing and Xiaohong Wang
	Jinan University, China
	ABSTRACT—This paper aims at the problems of low CPU utilization, poor independence

# Session III 16:00-18:15 Hongshan Hall @ 17th floor

	between tasks and poor stability of the system, which are common in the single-threaded
	data acquisition system of traditional cement enterprises, and carry out multi-threaded
	research and development for the data acquisition system of cement enterprises. The research
	and development uses the C# to complete the multi-threaded technology, uses the SQL
	Server 2012 to store the data, and realizes the collection of each data in the cement enterprise
	under the Visual Studio 2012 development environment. This paper first introduces the
	research of multi-threaded technology, and then introduces the design of this multi-threaded
	data acquisition system software and the design of specific modules. At the end of this paper,
	the design of data storage table structure and the realization of its function are introduced.
	A rapid localization method of radiation sources used for multi-sensor networks
	Shi Chuan and Zhang Yang
	LEETC, China
	ABSTRACT—When the distance information is used for localization, due to the influence
CA025	of system equipment and environmental disturbance, the distance measured will introduce
14:15-14:30	error, which affects the localization accuracy. Based on the multi-sensor network technology,
	the traditional range localization method is improved in this paper. A rapid localization
	method of radiation sources used for multi-sensor networks is provided, which can
	accomplish the target location of the radiation source effectively and improve the
	localization accuracy.
	Design of Angle Measurement System for Dual Polarization Monopulse Radar in Main lobe
	Jamming
CA026 14:30-14:45	Zhang Yang and Shi Chuan
	LEETC,China
	ABSTRACT—Aiming at the mainlobe jamming problem of monopulse radar, based on the
	method of dual polarization decoupling estimation, a design scheme of angle measurement
	system for dual polarization monopulse radar in mainlobe jamming is proposed. The
	monopulse radar is changed to the dual polarization receiving mode. Combined with the
	goniometry algorithm, the coupling error of the jamming on the target angle estimation can

	be eliminated and the target identification and tracking can be completed effectively.
	Pulse Shape Discrimination of n — γ Based on Pulse Shape Model and Adaptive Kalman
	Filter
	Mingfu He, <b>Hongkun Yu</b> , Mingzhe Liu and Bingqi Liu
	Chengdu University of Technology, China
	ABSTRACT—Motivated by drawbacks resulting from current neutron (n)-gamma (γ)
	discrimination methods, this paper proposes a new method of n-γdiscrimination on the basis
	of pulse shape model of scintillation detector and principals of adaptive Kalman filter. The
CA029 14:45-15:00	proposed method extensively exploits model parameters' differences between n and $\gamma$ ray.
	By properly establishing the state and measurement equations of linear Kalman filter based
	on pulse shape model with three exponential terms, the track framework of pulse signal is
	developed for a novel indicator of model residual denoting either the pure noisy component
	or a combination of model bias and noise. 7056 pulses signals sampled from a 252Cf source
	are studied for the performance comparison of discrimination between proposed method and
	other state-of-art methods. The qualitative and quantitative results demonstrated that the
	proposed method has better capacity of n-γdiscrimination.
	Prediction Model of Dissolved Oxygen Based on SADE-RVM
	Chengyun Zhu, Rong Wang and Qiaoying Tong
	School of New Energy and Electronic Technology, Yancheng Teachers University, China
	ABSTRACT—Dissolved oxygen (DO) directly affects the growth status of fishes in
	intensive aquaculture, thus we set up a prediction model to determine the future changing
CA035	trend of dissolved oxygen. The DO prediction model we proposed through fusing and
15:00-15:15	improving the self-adaptive differential evolution and relevance vector machine
	(SADE-RVM) in the paper. To evaluate and compare the performance of the SADE-RVM,
	the least squares support vector regression (LS-SVR), back propagation neural network (BP)
	and multivariate linear regression (MLR) model were used for comparison. The calculated
	mean absolute percentage errors of the results of the four prediction models were 0.35%,
	1.3%, 2.03% and 1.33%, respectively. The SADE-RVM model has a higher prediction

# Session III 16:00-18:15 Hongshan Hall @ 17th floor

	accuracy and more reliable performance than the other models. When the predicted values of
	dissolved oxygen fall below the safety level, the farmer can start an oxygen increasing
	machine in advance to maintain the safety of fishes. The prediction model was used in
	Yangzhong, Jiangsu province, China, and it performed well and helped farmers make
	decisions and reduce aquaculture risks.
	Vehicle Window Detection Based on Hough Transform and Integral Projection
	Xing Yang
	National University of Defense Technology, China
	ABSTRACT—Vehicle window size and position can provide important information for the
CA1010 15:15-15:30	occupant detection in the HOV system. Therefore, quickly and accurately locating and
13.13 13.30	extracting vehicle windows will greatly improve the processing speed and detection
	accuracy. According to the characteristics of vehicle windows, we employed Hough
	transform and Integration projection to cut the window region. Experimental results
	show that the algorithm has merits of high computing speed and high accuracy of detection.
	Contrapositive Margin Softmax Loss for Face Verification
	Dongxue Xu,Qijun Zhao
	College of Computer Science, Sichuan University, Chengdu, China
	ABSTRACTThe performance of face recognition has been boosted by the features
	extracted from deep convolutional neural networks. Ideal features should have minimum
	intra-class variations and maximum inter-class variations. The most commonly used loss
CA1024	function for classification, softmax loss, however, does not necessarily learn features
15:30-15:45	discriminative enough. Large margin classifiers have nice generalization properties in
	statistical machine learning. These properties have lead to the application of margin to deep
	learning in recent years. We hereby propose a new loss function called Contrapositive
	Margin Softmax loss for face verification task, which helps to learn invariant and
	discriminative features by introducing margins to both target logits and maximum negative
	logits of softmax loss. Competitive results on LFW (99.28%) and YTF (95.34%)
	demonstrate the effectiveness of our approach.

Adaptive Hierarchical Siamese Network for Object Tracking

Yongfeng Fang, Yun Wu, Bingyu Sun, Chaoyuan Cui□

Institute of Intelligent Machines, Hefei Institutes of Physical Science, Chinese Academy of Sciences, Hefei, China

University of Science and Technology of China, Hefei 230026, China

MV004 16:00-16:15 Abstract— A new object tracking algorithm based on hierarchical Siamese network is proposed to solve the challenges of target deformation and background interference in tracking tasks. The introduction of hierarchical features makes up for the lack of features information caused by too small target. A similarity measure mechanism is firstly learned through matching training of extracted hierarchical features on annotated datasets. Online target tracking is achieved by searching candidate images at multiple scales around the target center of the previous frame. The adaptive examplar and the first frame exemplar are used to measure the similarity of the current frame to obtain an accurate score map, which allows the algorithm to adapt to the change of the target. Our algorithm achieves real-time target tracking without online fine-tune and achieves long-term effective tracking on multiple challenging video sequences.

Lower Limb Movement Intent Recognition Based on Grid Search Random Forest Algorithm

Ge Song, Yucheng Wang, Mingming Wang and You Li

University of Science and Technology of China

CA008 16:15-16:30 ABSTRACT--Intent recognition is the key technique in the research of exoskeleton robot, which has become a necessary and important tool in recovering the elderly and disabled people's walking ability. In this work, four-channel surface EMG signals were used as the control signal for exoskeleton robot of lower limbs. In order to improve the recognition accuracy of human motion intent, a new classification method based on grid search random forest algorithm was proposed. Firstly, the EMG signals were collected from the selected muscles of the two lower limbs. Secondly, IFFT was used for signal preprocess, then a 36-dimention feature vector was extracted for the next step. Finally, the random forest algorithm optimized by grid search method (GS-RFA) was used to recognize the five motion

	patterns, i.e. go up stair, go down stair, sit, stand and walk. The average recognition accuracy
	of the three experiments for five motion patterns achieves 97.5%.
	Research of Unlabeled Identification Technology of Equipment Based on Machine Vision
	HUANG Shao-luo, <b>Zhang Jian-xin,</b> Gao Jian
	Army Engineering University, China
	ABSTRACTIn the grass-roots units, the speed of equipment identification directly affect
	the accuracy and timeliness of equipment maintenance. In this paper, several now-existing
CA1007 16:30-16:45	methods of identification are aggregated and combed. The problems in the supply-level
20.00 20.10	application of the spare parts are found, and a method for identifying the equipment entities
	called "Unlabeled Identification Technology of Equipment Based on Machine Vision" is
	proposed. In addition, the advantages of the method, which is very beneficial to the
	promotion of battlefield support ability, are obtained by comparing the differences between
	the old and new methods.
	Target tracking based on improved STRCF algorithm
	Xingting Yao, Yong Xu, Denggui Zhang
	Beijing Institute of Technology, China
	ABSTRACTTarget tracking gets great attention in recent years. The correlation filter uses
	Fast Fourier Transform (FFT) to convert the convolution in time domain to the
	multiplication operation in frequency domain, thereby effectively training the filter model.
	The initial tracking frequency based on the Discriminant Correlation Filter (DCF) can reach
CA1008 16:45-17:00	700 frames per second. DCF has progressed rapidly in recent years. Trackers such as
10.45-17.00	Spatially Regularized DCF (SRDCF) and Continuous Convolution Operator
	Tracker(C-COT) have a high degree of accuracy when tracking targets. However, while
	pursuing better tracking performance, the high-speed and real-time characteristics of the
	relevant filters are also gradually declined. The increase in the complexity of the model and
	the variety of target features increases the risk of over-fitting of these trackers. To solve these
	problems, this paper proposes three solutions: 1. Use deconvolution algorithm to reduce the
	dimensionality of input image features, thereby reducing the amount of model update

	operations, improve the speed of our tracker; 2. Prediction of the target position, which
	reduces the number of candidate boxes, speeds up the positioning process, and improves the
	tracking performance of moving targets. 3. Reduces the frequency of model updates, saves
	tracking time, and avoids model drift. Compared with STRCF, our tracker with deep features
	provides a 5× speedup with only 3.1% decrease in success plots rate (SR) on OTB-2015
	Visual Path Tracking Control for Park Scene
	Linjiong Zhu, Wenfu Wang, Weijie Yang, Zhijie Pan, An Chen
	College of Computer Science and Technology, Zhejiang University
	Abstract— Autonomous driving application is developing towards specific scenes. Park
	scene has features such as low speed, fixed routes, short connection, less complex traffic, and
	hence is suitable for bringing autonomous driving technology into reality. This paper targets
MV007	park scene, and proposes a visual path tracking lateral control method using only one
17:00-17:15	webcam. First, we calculate error of distance and error of angle from camera images, and
	then use fuzzy logic to fuzzify them into a combined error degree. The PID control algorithm
	takes it as input, and outputs steering wheel angle control command. Fuzzification could
	tolerate the error brought by image transformation and lane detection, making PID control
	more stably. Our experiments in both virtual and real scene show that our method can
	accurately and robustly follow the path, even at night. Compared with pure pursuit, our
	method can make 5 meters turning.
	The improved chaotic PSO for the optimization research on multi-cameras network
	Xiangjin Zeng, <b>Jinwen Tian</b>
CA002 17:15-17:30	College of computer science and engineering, Wuhan Institute of Technology, Intelligent
	robot key Laboratory of Hubei Province, China
	ABSTRACTThe multi cameras network design has many characteristics of the multi
	parameters and multiple constraints and large computation, which is an optimization strategy
	for complex problems in theory. We find usually the exact optimal solution to be require the
	very large computation. Therefore, the algorithm efficiency must be considered. In the paper,
	we employ the heuristic attribute reduction algorithms based on the identifiable matrix to

	reduce the attribute. Then predict the reduction attribute using the improved support vector
	machine. In order to obtain the optimal prediction accuracy, we use the chaotic particle
	swarm optimization (PSO) to prevent local optimization of SVM prediction models, which
	can make the prediction rate significantly increased. Finally, we compare the algorithm of
	particle swarm optimization , IPSO, CPSO for the multi camera network parameter
	optimization, and the analysis results show that, compared with other methods, the proposed
	method in convergence speed, prevent local optimization has improved performance.
	Quadratic Assignment Problem via a Convex and Concave Relaxations Procedure
	Lei He, Zhi-Yong Liu, Xu Yang, Feng-Yi Zhang
	Field Engineering College, Army Engineering University of PLA, Nanjing, China
	ABSTRACTThe convex and concave relaxations procedure (CCRP) was recently proposed
	to approximately solve the graph matching problem and exhibited a quite promising
	performance. To extend the CCRP to approximately solve the quadratic assignment problem
CA1005 17:30-17:45	(QAP), a major trouble is how to figure out the corresponding convex and concave
17.30 17.43	relaxation functions. In this paper we will propose a general but simple QAP algorithm, and
	will then prove that the algorithm is exactly an type of CCRP algorithm, but without needing
	to figure out the convex or concave relaxation function in an explicit way. The proposed
	algorithm can be generally used on symmetric and asymmetric QAP's, and is simple to
	implement. Extensive experimental comparisons on the QAPLib benchmark data sets
	witness a state-of-the-art performance of the proposed algorithm.
CA1004 17:45-18:00	Image Augmentation for Classifying Facial Expression Images by Using Deep Neural
	Network Pre-trained with Object Image Database
	Yoshihiro Shima and Yuki Omori
	Meisei University,Japan
	ABSTRACTImage augmentation of automatic facial expression classification is proposed
	on the basis of a combination of a deep neural network and a support vector machine. A
	neural network pre-trained with a large-scale object image database is used as a feature
	extractor for facial images. The accuracy of system performance is evaluated using the

16:00-18:15 Hongshan Hall @ 17th floor

database "ATR Facial Expression Image Database (DB99)." By using image augmentation, an average recognition rate of 97.92% was obtained, which was a 9.84 percentage point improvement compared with that without augmentation. The experimental results showed the effectiveness of our scheme.

AVIRO - Modular Perception System for Space Robotics

#### Marc Steven Krämer

ABSTRACT--The effective control of robots needs an exact environment model together with a current state description. The aim of AVIRO is the development of such a system. To generate a robust three-dimensional model of the environment, the system can be mounted with modular sensor devices. A multi-sensorfusion combines the data of several connected units in real-time. Parallel to this, position, attitude and speed of the system are determined continuously. For the recognition of the surroundings, we use lidar in combination with the images of multiple cameras. The pose is given by high precise microelectromechanical (MEMS) and fiber optical inertial measurement units (IMU). One major challenge is the automatic online recalibration of the complete system. Because of aging and thermal or mechanical stress, the position and orientation of the mounted sensors could change. To detect and compensate this a comparison between the IMU and an environment sensor based odometrie estimation is made. The processing part of AVIRO consists of two systems. With a field programmable gate array (FPGA) we make a preprocessing of the incoming sensor data. In this step, computationally intensive calculations, especially in the field of digital image processing is done in real-time. Finally, an embedded computer generates the environment model and state description. Unfavorable conditions such as those prevailing in space impose special challenges to the electronic components. Our system will be tested and qualified with technology readiness level 5 (TRL 5). The German Aerospace Center (DLR) founds the project AVIRO.

CA3004 18:00-18:15

### **POSTER**

Node centrality analysis of multiplex networks under Computer virus spreading Yuang Wang, Hongfu Liu, Baoan Ren and Jing Chen College of Intelligence Science and Engineering, National University of Defense Technology, Changsha, P.R.China Abstract—Computer virus are evolving by developing spreading mechanisms based on the use of multiple vectors of propagation. Finding important nodes in the network and taking action can effectively control the range and speed of the computer virus. Most of the current research on the influential spreaders is on the single-layer network level. However, compared MV006 with single-layer network, the influential spreaders of multiplex networks will be more realistic. In particular, we design the propagation of a susceptible-infected-susceptible (SIS) model on multiplex networks (not only double-layers networks) where the state of each node is layer-interconnected and the dynamics in each network follows either a contact process or a reactive process, with different propagation rates. Here we show that node evaluation indicators of single-layer network (such as degree centrality, eigenvector centrality, closeness centrality, betweenness centrality and so on) are still applicable in the multiplex networks. Visual place recognition based on multi-level CNN features Zhenqiang Bao, Aihua Li, Zhigao Cui, Jinming Zhang College of war support, Rocket Force University of Engineering, Xi'an, Shanxi, China Abstract—In this paper, we propose a visual place recognition (VPR) detection method which utilizes multi-level CNN features. High-level CNN features contain much semantic information and can deal with the change of viewpoint, middle-level CNN features contain MV1002 much geometric information and have good robustness to the change of light and so on. Fully integrating the advantages of high-level and middle-level CNN features, the place recognition detection method will own good robustness to challenge the environment with appearance and viewpoint changes. Due to the high dimension of CNN feature vectors, we pre-process the feature vectors before they are used to the detection. And we introduce how to choose the image representation and compute the similarity score in detail. Finally we

	perform the experiments on three open datasets with viewpoint and appearance changes,
	which indicate that the performance of multi-level CNN features outperforms any other
	single-level CNN features and Fab-Map2.0.
	Research on Terminal Guidance Law of Re-Entry Vehicle Attacking Slow Moving Target
	Song Chao, Li Zhiqiang and Hu Wenlin
	Naval Aviation University, China
	ABSTRACTA kind of terminal guidance law based on Gauss pseudo spectral method
CA007	(GPM) is provided for the target slowing moving property. Owing to high accuracy and fast
CAUU7	convergence, GPM was adopted to solve the optimal reentry trajectory satisfied some
	performance index and constraints, and the waypoints were set as corrected points.
	Predictor-correction guidance method was adopted to revise the location error at waypoints.
	Simulations prove that the guidance method has higher accuracy and can be used to guidance
	online.
	Dynamic Surface Active Disturbance Rejection Control for Two-Wheeled Self-Balancing
	Robot
	Chundong Wang, Jin Huang, Chao Wang and Rui Wu
	Dalian Maritime University, China
	ABSTRACTConsidering the control problem of two-wheeled self-balancing robot
	(TWSBR) under various disturbances, this paper combines the advantages of dynamic
	surface control (DSC) and active disturbance rejection control(ADRC) to get the dynamic
CA009	surface active disturbance rejection controller(DSADRC). Firstly, the "total disturbance" of
	the system is estimated by the expansion state observer after being linearized by dynamic
	compensation. Then, two DSC controllers are designed for the linearized vertical subsystem
	and displacement subsystem respectively, and a PD controller is designed for the steering
	subsystem. Two different robot models, which are constructed on the plane and the
	undulating surface with known and unknown disturbance, are simulated by the
	parameter-fixed DSC controller to verify the ability of disturbance rejection. The simulation
	results show that the DSADRC has a strong ability to restrain various disturbances.

	Gas Discharge Tube's Electromagnetic Pulse Response Prediction Based on Elman Neural
	Network
	Jinjin Wang, Xin Nie, Beiyun Sun, Wei Wang, Hui Xiang, Zhizhen Zhu, Yuewu Shi and
	Jing Yang
	State Key Laboratory of Intense Pulsed Radiation Simulation and Effect (Northwest Institute
	of Nuclear Technology)
	ABSTRACT—Electronic equipments may be disturbed by electromagnetic pulse during
CA013	operation in some fields. Gas discharge tube is usually added as surge protection device to
	protect electronic equipment from electromagnetic pulse. Electromagnetic pulse current
	injection experiment is used to test gas discharge tube's protective characteristics. In order to
	reduce experimental times and guide experimental process, Elman neural network was used
	to predict electromagnetic pulse responses of gas discharge tube. Elman neural network is a
	recurrent neural network with local memory units and local feedback connections.
	Experiments showed that the Elman neural network model on gas discharge tube at different
	grades of voltage injection experiments have had better prediction results.
	Effect of Temperature on COD Measurement by UV-Vis Spectroscopy
	Jiang Zhengfu, Li Xisheng and Shi Peihua
	University of Science and Technology Beijing, China
CA016	ABSTRACTChanges of temperature affect absorbance in the UV-Vis spectrum, thus when
	using UV-Vis spectroscopy to monitor COD, we should eliminate the effect of temperature
	on the spectrum. In this paper, the spectral data of COD standard solution will be measured
	at different temperatures through experiments, then use linear regression to fit the data and
	obtain the specific relationship between temperature and absorbance, finally to provide a
	method for spectroscopic monitoring of COD modeling optimization.
	Application of Wavelet and Wavelet Packet Transform in Water Quality Analysis Based on
CA017	UV-visible Spectrum
	Tingting Wang, Xisheng Li and Peihua Shi
	School of Automation University of Science and Technology Beijing, China

	ABSTRACTIn the online detection of water quality based on UV-Vis spectroscopy, there
	are different levels of interference in the original spectral signal. In order to improve the
	signal-to-noise ratio of the signal and the accuracy of the system parameter calculation, the
	original spectral signal acquired needs to be denoised. In this paper, the different water
	sample data obtained are processed by wavelet and wavelet packet transform, and the
	differences between the two methods are analyzed to determine the optimal denoising
	method for water quality spectral signals.
	A Cloud-based Control System Architecture for Multi-UAV
	Chen Hong and Dianxi Shi
	National Laboratory for Parallel and Distributed Processing(PDL), National University of
	Defense Technology, China
	ABSTRACTUnmanned aerial vehicle is considered one of the most promising
	technologies. Controlling UAV over the cloud is an emerging research area motivated by the
	emergence of Cloud Robotics and the Internet-of-Things (IoT). This paper presents a control
CA020	system architecture based on cloud platform which has been developed in order to allow
	multiple users to control and monitor multiple UAVs simultaneously irrespective of the
	location. Furthermore, the system allows to build and allocate missions to UAV and analyze
	the execution data that collect by sensors. The architecture of the system is fully based on
	open source software and protocols. To demonstrate the effectiveness of the system
	architecture, we implemented and validated it using SITL (software in the loop) simulator.
	Experimental results show that the system is efficient in monitoring and controlling UAV
	remotely through the Internet.
	Conservatism Reduction in Guaranteed Cost Control for a Class of Uncertain Nonlinear
CA031	Systems
	Zhuangyu Liu, Jiwei Wen and Li Peng
	Jiangnan university,China
	ABSTRACTThis paper develops a conservatism reduction approach for
	neural-network-based uncertain nonlinear systems to achieve guaranteed cost control. First, a

	multi-layer neural network model is used to approximate the nonlinearities in dynami			
	systems, and it is formulated as a linear difference inclusion (LDI) representation. Then, a			
	multi-step ahead Lyapunov function is developed for guaranteed-cost control based on the			
	LDI model. The advantage of such a Lyapunov function is to reduce the conservatism of the			
	linear matrix inequality constraints so that a lower upper bound of the linear quadratic			
	performance index could be expected. Finally, a numerical example is provided to			
	demonstrate the effectiveness of the proposed method.			
	Research on feature map generation based on Simultaneous localization and mapping			
CA1001	Wang Dandan; Tan Kaituo; Hongjie Li			
	College of Electronic Information and Electrical Engineering, Anyang Institute Of			
	Technology			
	Anyang, Henan Province, China			
	ABSTRACTIn view of the problems of the low precision for localization based on			
	traditional navigation with non-Gauss and non-linear model in underwater and the backward			
	pipeline detection method, a pipeline feature map generation algorithm based on the			
	simultaneous localization and mapping (SLAM) was proposed. By building the system state			
	model and observation model based on SLAM, it used Cubature Kalman Filter algorithm to			
	estimate and analysis the state of carrier and the characteristics, and the experimental results			
	showed that the new filtering algorithm could realize high precision navigation with small			
	error. Finally, it extracted the wreckage and pipeline characteristics with the Scan Invariant			
	Feature Transformation (SIFT) algorithm based on the SLAM, and the experimental results			
	proved that the new algorithm could achieve higher correlation of feature matching.			
CA1014	Action Recognition with 3D ConvNet-GRU Architecture			
	Guangle Yao, Xianyuan Liu and Tao Lei			
	University of Science and Technology of China, China			
	ABSTRACTVideo action recognition is widely applied in video indexing, intelligent			
	surveil-lance, multimedia understanding, and other fields. Recently, it was greatly improved			
	by incorporating the learning of deep information using convolutional neural network			

	(ConvNet). In this paper, we proposed a 3D ConvNet-GRU architecture to learn deep
	information for action recognition. Specifically, we use 3D ConvNet to learn spatiotemporal
	information from short RGB clips and optical flow clips, and impose gated recurrent unit
	(GRU) on the spatiotemporal in-formation to model the temporal evolution for action
	recognition. The experimental results show that our 3D ConvNet-GRU method is effective to
	model temporal evolution for action and achieves recognition performance comparable to
	that of state-of-the-art methods.
	A Discriminatively Learning Model with Illumination Transfer for Inter-Camera Pedestrians
CA1015	Association
	Shijun Zhong, Chunyan Yu and Jiali Lin
	University of Science and Technology of China, China
	ABSTRACTInter-camera pedestrians association always employs appearance features to
	merge tractlets of the same pedestrian into a whole. However, appearance features are
	always view- and illumination- sensitive. In this paper, we present a method to solve
	inter-camera pedestrian association via discriminative learned feature in a stable way with
	illumination transfer. First, we proposed a discriminative feature learning model which is a
	convolution siamese network that combines the verification and identification losses.
	Furthermore, we introduce color brightness transfer reduce color distortions under different
	illumination. To learn proper brightness transfer function, a fuzzy color cluster is used to
	model the change of color brightness between different cameras. The experiments show the
	effectiveness of the proposed method and achieve the state-of-the-art in the benchmark
	NLRP_MCT dataset.
CA1018	Research on The boundary recognition of self-walking agriculture machine based on Vision
	Yibo Li and Qiushi Wang
	Shenyang Aerospace University, China
	ABSTRACTThe boundary recognition algorithm of self-walking agricultural machine
	based on vision was proposed in this paper, which combined 2D-gabor with uniform pattern
	of LBP to extract the texture features of boundary area .After that, an algorithm that fuzzy
